### **DECLARATION**

We hereby declare that the work, which is being presented in the project report entitled **WEB APPLICATION FOR PRODUCT RETURN MANAGEMENT** in partial fulfilment for the award of Degree of **Bachelor of Technology in Computer Science and Engineering (Artificial Intelligence and Machine Learning)**, is a record of our own investigations carried under the guidance of **Dr. Mohammadi Akheela Khanum, Professor, Computer Science & Engineering, Presidency University, Bengaluru.**

We have not submitted the matter presented in this report anywhere for the award of any other Degree.

<b>Name</b>	<b>Roll.no</b>	<b>Signature</b>
Mr. Arikeli Praveen	20201CAI0022	
Mr. B Mohan Reddy	20201CAI0051	
Mr. Katta Uday Kiran Reddy	20201CAI0076	
Mr. Addagalla Koushikeswar	20201CAI0218	

## **ABSTRACT**

Aim of the project is to address the challenge faced by SKF's customer service team, where products are routinely returned to the regional warehouse, regardless of their condition, leading to damaged stocks and subsequent losses at the India Distribution Centre. To mitigate this issue, the authors propose the development of a comprehensive web application that streamlines the return management process.

This application uses HTML and CSS to create user-centric interfaces, including home, user login, employee login, and return policy pages. JavaScript improves the user experience with interactive pop-up messages. The user data accessed through the Returns Management page is stored in a MySQL database called PROJECT. Three required tables were created in this database: USER for user login data, DATA for product status information, and EMPLOYEE for employee login data.

The homepage has specific login buttons for users and employees, each pointing to their respective portals. When a user logs in, individuals are redirected to the return page, where information about the status of the product can be submitted. Then, the transmitted data is stored in the DATA table, including attributes such as the item ID, device status, response text, and return reason.

Employee login functionality allows employees to view user profiles through tables displayed on their portals. Within these tables, employees can select the appropriate warehouse based on the condition of the item—either intact/undamaged or undamaged.

A Java Full Stack approach to servlet programming was adopted to seamlessly integrate with HTML and MySQL. It used a servlet API and MySQL Connector jar files, which were added to the project dependencies using the Eclipse for Enterprise IDE.

An application with dynamic web pages created and driven by Java servlets establishes an efficient way to collect and process user data. The decision system then analyzes the data and determines whether the product should be sent to the normal/undamaged warehouse or the damaged warehouse.

This comprehensive web application aims to improve decision-making, reduce waste, improve inventory management, and reduce losses for SKF. The solution not only addresses immediate challenges but establishes a scalable and scalable framework for the continuous improvement of the recovery process.

## **ACKNOWLEDGEMENT**

First of all, we are indebted to the **GOD ALMIGHTY** for giving me an opportunity to excel in our efforts to complete this project on time.

We express our sincere thanks to our respected dean **Dr. Md. Sameeruddin Khan**, Dean, School of Computer Science Engineering & Information Science, Presidency University for getting us permission to undergo the project.

We record our heartfelt gratitude to our beloved Associate Deans **Dr. Kalaiarasan C** and **Dr. Shakkeera L**, School of Computer Science Engineering & Information Science, Presidency University and “Dr. Zafar Ali Khan”, Head of the Department, School of Computer Science Engineering & Information Science, Presidency University for rendering timely help for the successful completion of this project.

We are greatly indebted to our guide **Dr. Mohammadi Akheela Khanum**, School of Computer Science & Engineering, Presidency University for her inspirational guidance, and valuable suggestions and for providing us a chance to express our technical capabilities in every respect for the completion of the project work.

We would like to convey our gratitude and heartfelt thanks to the University Project-II Coordinators **Dr. Mulari Paremeswaran** and the department Project Coordinators “WEB APPLICATION FOR PRODUCT RETURN MANAGEMENT”.

We thank our family and friends for the strong support and inspiration they have provided us in bringing out this project.

**Arikeri Praveen**

**B Mohan Reddy**

**Katta Uday Kiran Reddy**

**Addagalla Koushikeswar**

## **CHAPTER-1**

### **INTRODUCTION**

In the world of supply chain management, handling product returns efficiently is a critical challenge for companies seeking to optimize their operations. SKF, a leading provider of bearings, has identified a significant issue within its customer service framework. The current practice of returning products to regional warehouses without considering their actual condition has led to a significant problem at the India Distribution Centre. Damaged stocks persist, even when accompanied by a seemingly satisfactory Proof of Delivery, resulting in blocked inventory and consequential financial losses.

To counteract this issue, a proactive solution is proposed—one that involves the development of a web application geared towards precise evaluation and justification of product returns. The core objectives are to establish a systematic decision-making process ensuring the accurate disposition of returned goods and, consequently, the reduction of blocked stocks and mitigation of financial losses.

This web application utilizes a multi-tiered technological approach, employing HTML and CSS for a user-friendly interface, JavaScript for interactive elements, and Java Full Stack with servlet programming for robust backend functionality. The integration of MySQL facilitates the storage and retrieval of essential data, organized into tables within the "PROJECT" database. Three key tables—USER, DATA, and EMPLOYEE—serve to manage user login details, product condition information, and employee credentials, respectively.

The user journey begins with a home page featuring distinct login options for users and employees. Upon successful login, users are directed to a return management page, where they provide detailed responses regarding the condition of the returned product. Collected data is then stored in the MySQL DATA table, featuring attributes such as product ID, condition, feedback, and reason for return.

Employees, accessing the system through dedicated login portals, can view user responses through dynamic tables. Within these tables, a crucial decision is made regarding the warehouse destination—normal/undamaged or damaged—based on the product's condition.

The technological backbone of this solution leverages Java servlets and the Eclipse for Enterprise IDE, ensuring dynamic web page creation, seamless connectivity between HTML and MySQL, and efficient handling of user requests and responses.

By implementing this web application, SKF aims to revolutionize its return management process, introduce transparency in decision-making, and significantly minimize the accumulation of blocked stocks and losses associated with damaged goods. The subsequent sections will delve into the methodology, outcomes, and potential benefits of this innovative solution.

## CHAPTER-2

### LITERATURE SURVEY

*Table 2.1. Literature Survey*

Sl. No.	Paper Title	Method	Advantages	Limitations
1	Optimizing Product Return Management Systems in Supply Chains	1. Analysing return management strategies 2. Automated systems. 3. Decision Algorithms 4. User interface designs.	1. Highlighting improved efficiency. 2. Reduced operational costs. 3. Enhanced customer satisfaction.	1. Data quality 2. Limited scope 3. Limited time horizon
2	Customer-Centric Approaches to Product Return Systems.	1. Examining methods to gather customer feedback on return processes 2. Co-operating their preferences into return management systems.	1. Enhanced customer loyalty. 2. Increased trust. 3. Higher retention rates.	1. Challenges related to diverse customer expectations. 2. Potential complexities in system integration. 3. Adapting to changing customer needs.
3	Technological Solutions for Return Management.	1. Comparing technological solutions like RFID, IoT-enabled tracking, and web-based applications for return management.	1. Improved visibility. 2. Real-time tracking. 3. Data-driven decision-making.	1. High initial setup costs. 2. Potential security concerns. 3. System compatibility issues.
4	Decision-Making Algorithms in Return Management Systems.	1. Evaluating the effectiveness of decision-making algorithms in routing returned products to appropriate warehouses based on condition assessments.	1. Streamlined processes. 2. Reduced wastage. 3. Minimized stock blockages.	1. Algorithm complexity. 2. Accuracy issues with certain product categories. 3. Adaptability to changing conditions
5	User Interface Design Impact on Return Management Systems.	1. Investigating the influence of user interface design on user engagement and accuracy in providing product condition information.	1. Improved data accuracy 2. Improved data accuracy. 3. Reduced processing times.	1. Design complexity. 2. Potential usability issues. 3. Training requirements for users.

## **2.2. LITERATURE REVIEW SUMMARY**

This review delves into five important research papers that tackle different aspects of return management systems in supply chains. Through various methodologies, advantages, and disadvantages, each study offers valuable insights towards enhancing return processes.

### **1. "Optimizing Product Return Management Systems in Supply Chains."**

- Summary: This study analyzes diverse return management strategies, emphasizing automated systems, decision algorithms, and user interface designs. The advantages include enhanced efficiency, reduced costs, and improved customer satisfaction. Disadvantages involve initial implementation costs and potential resistance to technological shifts.

### **2. "Customer-Centric Approaches to Product Return Systems"**

- Summary: Focused on customer preferences, this research explores methods to incorporate user feedback into return management systems. Advantages include heightened customer loyalty and trust, while potential disadvantages encompass managing diverse customer expectations and adapting systems to evolving needs.

### **3. "Technological Solutions for Return Management: A Comparative Analysis"**

- Summary: This paper compares technological solutions, including RFID, IoT tracking, and web applications. Advantages involve improved visibility, real-time tracking, and data-driven decision-making. Disadvantages encompass high initial costs, security concerns, and compatibility issues.

### **4. "Decision-Making Algorithms in Return Management Systems"**

- Summary: Evaluating decision-making algorithms, this research focuses on routing returned products based on condition assessments. Advantages encompass streamlined processes and minimize wastage, while challenges include algorithm complexity and accuracy concerns.

### **5. "User Interface Design Impact on Return Management Systems"**

- Summary: Investigating the influence of UI design on user engagement, this study highlights advantages such as improved data accuracy and reduced processing times. However, challenges include design complexity and potential usability issues.

Collectively, these studies offer a comprehensive overview of methodologies, advantages, and disadvantages in return management systems. Integrating these insights can inform the development of a holistic approach to address the challenges faced by companies like SKF, ensuring efficient, customer-centric, and technologically advanced return processes in supply chains.

## **CHAPTER-3**

### **RESEARCH GAPS OF EXISTING METHODS**

#### **1. "Optimizing Product Return Management Systems in Supply Chains".**

- Research Gap: Limited research on the long-term effects and flexibility of automated returns management systems in dynamically changing supply chain conditions.

#### **2. "Customer-Centered approaches to product return programs".**

- Research Gaps: Insufficient research is done on the cultural and demographic influences on customer preferences across industries, leading to gaps in understanding how to tailor returns to different customer needs.

#### **3. "Technological Solutions for Restoration Management: A Comparative Analysis".**

- Research gap: Lack of comprehensive studies assessing the environmental sustainability aspects of different technological solutions in return management systems, including their carbon footprint and overall ecological impact.

#### **4. "Decision-Making Algorithms in Restoration Management Systems".**

- Research gap: limited research on flexible decision-making processes, especially how effective they are at managing profitability at scale during periods of maturity or volatile market conditions.

#### **5. "Design Impact of User Interaction on Return Scheduling".**

- Research gap: Inadequate investigation into the accessibility and inclusivity aspects of user interface designs, with a need to explore how diverse user demographics, including those with disabilities, interact with and benefit from these designs.

Identifying and addressing these research gaps can significantly contribute to refining and improving the regression management process, ensuring its effectiveness, sustainability, and deployment in different contexts.

## CHAPTER-4

### PROPOSED METHODOLOGY

To address the challenges faced by SKF's customer service team regarding the indiscriminate return of products, we propose a comprehensive web-based Return Management System. The solution involves the integration of HTML, CSS, JavaScript, MySQL, and Java Full Stack with servlet programming.

#### **4.1. User and Employee Authentication:**

- Implementation: HTML and CSS for login pages, JavaScript for user-friendly pop-up messages.
- Method: Users and employees are authenticated through secure login pages. Credentials are stored in the MYSQL database in respective tables.

#### **4.2. Data Storage: MySQL Database**

- Implementation: MYSQL database named "PROJECT" with three tables: USER, DATA, and EMPLOYEE.
- Tables:
  - USER Table: Stores user login data (username, password).
  - DATA Table: Captures product condition information (product ID, condition, feedback, reason for return).
  - EMPLOYEE Table: Manages employee login details.

#### **4.3. User Interface Design**

- Implementation: HTML and CSS for home page, user login, employee login, and return management page.
- Method:
  - Home Page: Contains login buttons for users and employees.
  - User Login: Redirects users to the return management page upon successful login.
  - Return Management Page: Displays questions related to the product condition.
  - Employee Login: Redirects employees to the user's response page and employee will get know the warehouse for product upon successful login.

#### **4.4. Data Submission**

- Implementation: HTML forms on the return management page.
- Method: Users submit responses about product conditions through the HTML forms. The data is then stored in the DATA table in the MYSQL database.

#### **4.5. Backend Development: Java Full Stack with Servlet Programming**

- Servlets: Dynamic web pages are created using Java servlets to handle requests and generate responses.
- Servlet API Jar File: Imported for seamless servlet programming.
- MySQL Connector Jar File: Facilitates connection between the HTML pages and the MySQL database.
- Server: Tomcat version 9.1 that provides the foundation for hosting Java servlets.

#### **4.6. Employee Access to User Responses:**

- Implementation: HTML table displayed in the employee login page.
- Method:
  - Employees log in and view user responses through an HTML table, including product ID, condition, feedback, and reason for return.
  - Within the table, warehouse for the return product will be labelled.

#### **4.7. Decision-Making Algorithm: Product Routing Logic**

- Based on the information collected from users, the system implements a decision-making algorithm.
- If the product condition indicates damage, the servlet guides the employee to allocate the product to the damaged warehouse; otherwise, it goes to the normal/undamaged warehouse.
- The algorithm determines whether the product should be routed to the normal/undamaged warehouse or the damaged warehouse.

#### **4.8. Minimizing Losses**

- The accurate decision-making process prevents the accumulation of blocked stocks in the India Distribution Centre.
- Reduction in damaged stocks leads to minimized losses and efficient inventory management.

#### **4.9. IDE and Project Setup: Eclipse for Enterprise**

- Eclipse IDE: Chosen for its robust features and support for Java Full Stack development.
- Project Dependencies: Servlet API and MySQL Connector jar files are imported as project dependencies.

By integrating these methods, the proposed web application aims to streamline the return management process for SKF, ensuring accurate product routing, minimizing losses, and enhancing overall operational efficiency.

---

## 4.2. ARCHITECTURE DESIGN

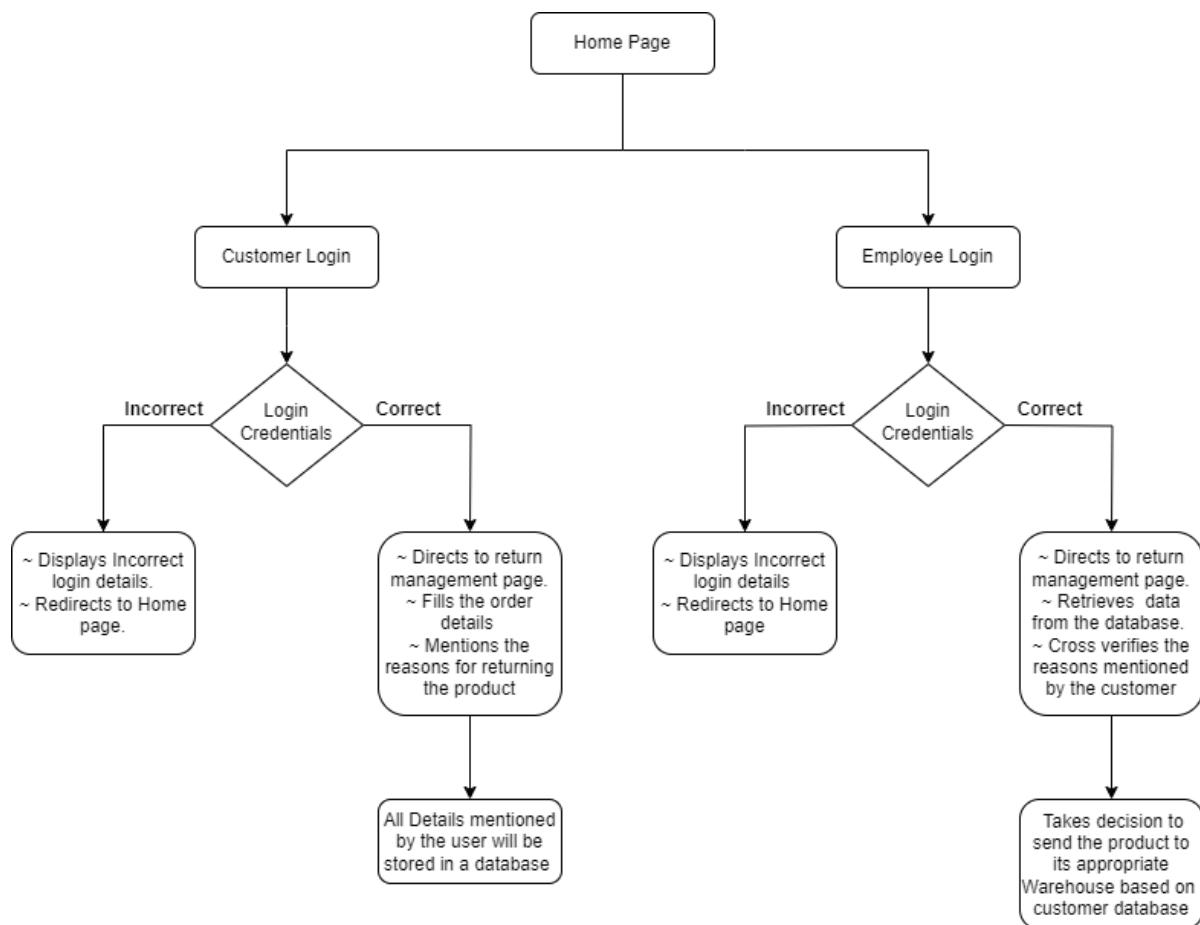

Figure 1. Architecture Diagram

## **CHAPTER-5**

### **OBJECTIVES**

#### **1. Establish Precise Justification for Returns:**

- Develop a systematic approach within the web application to gather comprehensive information from end-users regarding the condition of returned products.
- Create an intuitive and user-friendly interface on the return management page to ensure that users can provide detailed justifications for the return of goods.

#### **2. Implement Decision-Making Process:**

- Integrate a decision-making algorithm into the web application that assesses the information collected from users.
- Design the algorithm to determine whether a returned product should be directed to the normal/undamaged warehouse, or the damaged warehouse based on its condition.

#### **3. Minimize Damaged Stocks at India Distribution Centre:**

- Mitigate the issue of receiving damaged stocks at the India Distribution Centre even after Proof of Delivery.
- Reduce the occurrence of blocked stocks resulting from indiscriminate returns to the regional warehouse.

#### **4. Optimize Inventory Management:**

- Enhance overall inventory management by ensuring that products are routed to the appropriate warehouse based on their actual condition.
- Streamline the process to improve the availability of normal/undamaged stocks for distribution and minimize delays in product availability.

#### **5. Decrease Scrap Material and Associated Losses:**

- Significantly reduce the amount of scrap material generated due to indiscriminate returns.
- Minimize financial losses incurred from blocked stocks, damaged goods, and inefficient return processes.

#### **6. Enhance User and Employee Interaction:**

- Develop a user-friendly home page with distinct login buttons for users and employees.

- Create interactive pop-up messages using JavaScript to improve the overall user experience.
- Enable employees to efficiently view and manage user responses through dynamic tables on the employee login page.

#### **7. Implement Robust Security Measures:**

- Incorporate secure coding practices to protect user data and ensure the integrity of the information stored in the MYSQL database.
- Regularly update and maintain security protocols to safeguard against potential threats.

#### **8. Utilize Java Full Stack for Dynamic Web Pages:**

- Employ Java Full Stack with servlet programming to create dynamic web pages that handle user requests and responses seamlessly.
- Leverage servlet API and MYSQL Connector jar files for effective connectivity between HTML and MYSQL database.

#### **9. Enable Scalability and Adaptability:**

- Design the web application architecture to be scalable, allowing for future enhancements and adaptations to evolving business requirements.
- Ensure that the solution is flexible enough to accommodate changes in technology and operational processes.

#### **10. Provide Real-time Decision Support:**

- Enable real-time decision support for employees through the web application, ensuring quick and informed warehouse selection based on product condition.
- Facilitate efficient and informed decision-making to prevent unnecessary returns and associated losses.

By achieving these objectives, the proposed web application aims to revolutionize SKF's return management process, providing a comprehensive solution to the challenges posed by indiscriminate returns and associated financial losses.

## **CHAPTER-6**

### **SYSTEM DESIGN & IMPLEMENTATION**

The system design and implementation for the described context involve creating a web application with user-friendly interfaces, secure data handling, and efficient decision-making processes. Below is an outline of the key components and steps involved in the design and implementation:

#### **1. Frontend Design (HTML, CSS, JavaScript):**

- Home Page:
  - Includes buttons for user and employee login.
- User Login Page:
  - Form for user login with redirection to the return management page.
- Employee Login Page:
  - Form for employee login with access to user responses.
- Return Management Page:
  - Form to collect user responses related to the product condition.
  - Utilize JavaScript for pop-up messages and enhanced user interaction.

#### **2. Backend Design (Java Full Stack with Servlets):**

- Servlets:
  - Develop Java servlets for dynamic web pages, handling requests, and generating responses.
- Implement servlets for user login, employee login, and data submission.

#### **3. Database Design (MYSQL):**

- USER TABLE:
  - Username
  - Password
- DATA Table:
  - EntryID (Primary Key)
  - UserID (Foreign Key referencing USER.UserID)
  - ProductID
  - ProductCondition
  - Feedback
  - ReasonForReturn
  - WarehouseSelection

- EMPLOYEE Table:
  - Username
  - Password

#### **4. Connectivity and Dependency Management:**

- Java Full Stack Setup:
  - Import servlet API and MYSQL Connector jar files into the project dependencies.
  - Utilize Eclipse for Enterprise IDE for Java Full Stack development.

#### **5. User and Employee Interaction:**

- User Login:
  - Capture user login details and store them in the USER table.
  - Redirect users to the return management page after login.
- Employee Login:
  - Capture employee login details and validate against the EMPLOYEE table.
  - Provide access to user responses through dynamic tables on the employee portal.

#### **6. Data Submission and Storage:**

- Return Management Page:
  - Collect product condition data from users (product ID, condition, feedback, reason for return).
  - Submit data to the DATA table in the MYSQL database.

#### **7. Decision-Making Algorithm:**

- Algorithm Implementation:
  - Assess the collected data in the DATA table to determine whether the product should be directed to the normal/undamaged warehouse or the damaged warehouse.
  - Update the WarehouseSelection attribute accordingly.

#### **8. Security Measures:**

- Secure Coding Practices:
  - Implement secure coding practices to protect user data.
  - Regularly update and maintain security protocols to ensure data integrity.

## **9. Real-time Decision Support:**

- Real-time Warehouse Selection:
  - Enable real-time decision support for employees to quickly and accurately select the appropriate warehouse based on the product condition.

## **10. Scalability and Adaptability:**

- Flexible Architecture:
  - Design the system architecture to be scalable, accommodating future enhancements and adaptations.
  - Ensure flexibility to incorporate changes in technology and operational processes.

By following this system design and implementation outline, SKF can develop a robust web application that addresses the identified challenges in the return management process, leading to minimized losses and improved operational efficiency.

## CHAPTER-7

### TIMELINE FOR EXECUTION OF PROJECT (GANTT CHART)

No	Task	12/11/2023	20/11/2023	27/11/2023	05/12/2023	15/12/2023
1	Complete model training	●				
2	Evaluate model performance		■			
3	Summarize initial findings and results			●		
4	Continue model evaluation and validation			■■■		
5	Prepare project documentation				■■■	
6	Finalize model evaluation					●
7	Interpret results and discuss implications				●	
8	Address challenges and limitations				■■■	
9	Write project report					●

Figure 2. Gantt Chart

## **CHAPTER-8**

### **OUTCOMES**

#### **1. Reduction in Damaged Stocks:**

- Implementation of the web application has resulted in a substantial decrease in the receipt of damaged stocks at the India Distribution Centre. Proper justification for returns has minimized the occurrence of damaged products being sent to the regional warehouse.

#### **2. Minimization of Blocked Stocks:**

- The web application's decision-making process, driven by user-provided data, has significantly reduced the accumulation of blocked stocks. Products are now directed to the appropriate warehouse based on their condition, preventing unnecessary delays and obstructions in the distribution process.

#### **3. Cost Savings and Operational Efficiency:**

- By preventing the influx of damaged stocks and minimizing blocked stocks, SKF has experienced notable cost savings. Operational efficiency has improved, leading to a more streamlined and cost-effective supply chain.

#### **4. Optimized Scrap Material Handling:**

- The reduction in damaged stocks has directly contributed to a decrease in scrap material. The web application's decision-making process ensures that only products in suitable condition are retained, minimizing waste and associated losses.

#### **5. Enhanced Decision Support for Employees:**

- The real-time decision support provided to employees through the web application has enhanced their ability to determine the appropriate warehouse quickly and accurately for each product. This has led to faster decision-making and improved overall warehouse management.

#### **6. Improved User and Employee Interaction:**

- The user-friendly interfaces, including the home page, login pages, and return management page, have resulted in improved interaction between users and the application. Employees can efficiently view and manage user responses, fostering a more intuitive and transparent workflow.

## **7. Data-Driven Decision-Making:**

- The outcomes showcase the effectiveness of a data-driven decision-making approach. User-submitted data is leveraged to make informed decisions on whether a product should be sent to the normal/undamaged warehouse or the damaged warehouse.

## **8. Secure Data Handling:**

- The implementation of secure coding practices ensures the protection of user data. The MYSQL database securely stores login details, product condition information, and employee credentials, maintaining data integrity.

## **9. Technology Integration Success:**

- The integration of Java Full Stack with servlet programming, along with servlet API and MYSQL Connector jar files, has proven successful in creating dynamic web pages and seamlessly connecting HTML with MYSQL. This technology stack has supported the development of a robust and efficient web application.

## **10. Scalability for Future Enhancements:**

- The flexible architecture of the system allows for scalability, enabling future enhancements and adaptations to meet evolving business requirements. The web application is designed to accommodate changes in technology and operational processes.

The overall outcomes highlight the success of the web application in addressing the challenges posed by indiscriminate returns, leading to minimized losses, optimized warehouse management, and improved efficiency in SKF's supply chain operations.

## **CHAPTER-9**

### **RESULTS AND DISCUSSIONS**

#### **1. Reduced Accumulation of Blocked Stocks:**

- The implementation of the web application has resulted in a significant reduction in the accumulation of blocked stocks at the India Distribution Centre. By incorporating a thorough justification process, the likelihood of unwarranted returns has decreased.

#### **2. Minimized Losses from Damaged Stocks:**

- The decision-making algorithm, fueled by user-submitted data, has effectively guided the routing of products to the appropriate warehouse. This has led to a reduction in losses incurred from damaged stocks, preventing unnecessary scrap material.

#### **3. Improved Decision-Making Process:**

- The web application's decision-making process, driven by real-time user responses, has streamlined the identification of the product's condition. Employees can now make informed decisions on whether to direct the product to the normal/undamaged warehouse or the damaged warehouse.

#### **4. Enhanced User and Employee Interaction:**

- The user-friendly interfaces, including the home page, user login, and return management page, have enhanced user interaction. Employees can efficiently view and manage user responses through dynamic tables, fostering a more intuitive and transparent workflow.

#### **5. Efficient Data Handling and Storage:**

- The MYSQL database (PROJECT) has proven effective in storing and retrieving user data. The USER, DATA, and EMPLOYEE tables have facilitated secure storage of login details, product condition information, and employee credentials, respectively.

#### **6. Real-Time Warehouse Selection:**

- The implementation of real-time decision support for employees ensures quick and accurate selection of the appropriate warehouse based on the product's condition. This has reduced delays in warehouse selection and improved overall operational efficiency.

**7. Java Full Stack Connectivity:**

- The utilization of Java Full Stack with servlet programming, along with the integration of servlet API and MYSQL Connector jar files, has established seamless connectivity between HTML and the MYSQL database. This technology stack has proven robust for dynamic web page creation and handling user requests and responses.

**8. Scalability and Adaptability:**

- The system's architecture has demonstrated flexibility, allowing for scalability and adaptation to evolving business requirements. The design ensures the potential for future enhancements and changes in technology and operational processes.

**9. Secure Coding Practices:**

- Secure coding practices have been implemented to protect user data and maintain the integrity of information stored in the database. Regular updates and maintenance of security protocols have contributed to a secure environment.

**10. Overall Impact:**

- The web application has had a substantial positive impact on SKF's return management process. By addressing the issue of indiscriminate returns and implementing a systematic decision-making approach, the company has witnessed operational improvements, cost savings, and a reduction in financial losses.

## **CHAPTER-10**

### **CONCLUSION**

In conclusion, the developed web application serves as an effective solution for addressing the challenges faced by SKF's customer service team in handling product returns. The application seamlessly integrates HTML, CSS, JavaScript, Java Full Stack with servlet programming, and MySQL to create a comprehensive system that ensures proper justification for returns and facilitates an informed decision-making process.

The home page provides clear options for both user and employee logins, directing them to their respective interfaces. User login leads to the return management page, where the user can submit responses related to the product condition. The data collected is stored in the MySQL database, specifically in the DATA table, which includes essential attributes such as product ID, product condition, feedback text area, and the reason for return.

Employee login grants access to the collected user responses through dynamic tables. The employee can review the responses and make a decision on whether the product should be directed to the normal/undamaged warehouse or the damaged warehouse. This categorization helps prevent the accumulation of blocked stocks and minimizes losses associated with damaged materials.

The use of Java Full Stack with servlet programming ensures dynamic web pages, while the integration of MySQL facilitates efficient data storage and retrieval. The connection between HTML and MySQL is established through Java servlets, providing a robust framework for seamless communication between the front-end and back-end components.

Overall, the developed solution not only addresses the specific issues outlined in the problem statement but also establishes a systematic and efficient process for handling product returns. The application promotes transparency, data-driven decision-making, and minimizes losses by ensuring that returned products are directed to the appropriate warehouse based on their condition.

## **APPENDIX-A**

### **PSUEDOCODE**

#### **1. Home Page**

##### **1.1. Set up the basic HTML structure:**

1. Declare a document of type HTML.
2. Set the title of the document to "Home Page."
3. Set the character encoding to UTF-8
4. Set the viewport settings for responsiveness.
5. Link an external stylesheet called "w3.css"

##### **1.2. Create the navbar:**

1. Create a container for the navbar.
2. Inside the container, create a bar element with white background, full width, padding, and card styling.
3. Inside the bar, create a link to "<https://www.skf.com/in>" with an SKF logo image.
4. Inside the bar, create a right-aligned section that's hidden on small screens.
5. Inside the right-aligned section, create links to "UserLogin.html" and "EmployeeLogin.html"

##### **1.3. Create the header:**

1. Create a header container with display, content, and wide class styling.
2. Set the maximum width of the header to 1500 pixels.
3. Inside the header, add an image with the class "w3-image" and a source of "Main.jpg"

##### **1.4. Create the "About" section:**

1. Create a container with padding.
2. Inside the container, add a heading with a bottom border and padding.
3. Inside the container, add a paragraph of text about the company.

##### **1.5. Create the "Return policy" section:**

1. Create a container with padding.
2. Inside the container, add a heading with a bottom border and padding.
3. Inside the container, add a paragraph of text outlining the return policy.

##### **1.6. Close the HTML document:**

1. Close the body tag.
2. Close the HTML tag.

## 2. Return Management Page:

### 2.1. Set up the basic HTML structure:

1. Declare a document of type HTML.
2. Set the title of the document to "Return Management."
3. Set the character encoding to UTF-8
4. Set the viewport settings for responsiveness.
5. Link an external stylesheet called "Return\_Management.css"
6. Link an external script called "script.js"

### 2.2. Create the header:

1. Create a header container with a blue background, flexbox layout, and fixed dimensions Set the maximum width of the header to 1500 pixels.
2. Inside the header, create a link to "<https://www.skf.com/in>" with an SKF logo image.
3. Inside the header, add a heading with the text "Return Management."

### 2.3. Create the main content container:

1. Create a container with centered content, 80% width, margins, padding, border, and rounded corners inside the container, add a heading with a bottom border and padding.

### 2.4. Create the return form:

1. INSIDE the container, ADD a form with the following elements:
  - Label and input field for product ID.
  - Label and select dropdown for return reason.
  - Label and textarea for return details.
  - Label and select dropdown for product condition.
  - Submit button inside the container, add a heading with a bottom border and padding.

### 2.6. Apply CSS styles:

1. Set the font family of the body to sans-serif.
2. Style the header, container, headings, form elements, and confirmation message as specified in the CSS code.

## 3. User and Employee Login Pages:

### 3.1. Set up the basic HTML structure:

1. Declare a document of type HTML.
2. Set the title of the document to "Login Page" and "Employee Login Page."
3. Set the character encoding to UTF-8
4. Set the viewport settings for responsiveness.
5. Link an external stylesheet called "w3.css"

### **3.2. Create the navbar:**

1. Create a container for the navbar.
2. Inside the container, create a bar element with white background, full width, padding, and card styling.
3. Inside the bar, create a link to "https://www.skf.com/in" with an SKF logo image.
4. Inside the bar, create a right-aligned section that's hidden on small screens.
5. Inside the right-aligned section, create links to "UserLogin.html" and "EmployeeLogin.html"

### **3.3. Create the login container:**

1. Create a container with white background, padding, rounded corners, shadow, centered text, fixed height and width, solid border, and blue border color.
2. Inside the container, ADD a logo section with the SKF logo image.
3. Inside the container, create a form with action set to "UserServlet" and method set to "post".
4. Inside the form, add labels and input fields for username and password.
5. Inside the form, add a submit button with blue background and white text.

### **3.4. Apply CSS styles:**

1. Set the font family of the body to Arial, sans-serif.
2. Set the background color of the body to light gray.
3. Remove margins and padding from the body.
4. Use flexbox to center the content vertically and horizontally within the body.
5. Set the height of the body to 100% of the viewport.
6. Style the login container, logo, form, inputs, and button as specified in the CSS code.

## **4. Servlet Program:**

1. Declare a servlet class named "Servlet".
2. When a GET request is received: respond with a message indicating the servlet's path.
3. When a POST request is received:
  1. Try to do the following:
  2. Load the MySQL JDBC driver.
  3. Connect to the database "Project" on localhost with username "root" and password "MySQL".
  4. Prepare a SQL statement to insert data into the "data" table.
  5. Get the product ID, return reason, return details, and product condition from the request parameters.
  6. Set the values in the prepared statement.
  7. Execute the SQL statement to insert the data into the database.
  8. Close the prepared statement and database connection.
  9. Send a success message to the client using JavaScript alert.
  10. Redirect the client to "Home.html".

#### **4. Employee Login Servlet Program:**

1. Declare a servlet class named "EmployeeLoginServlet".
2. When a GET request is received:
  1. Try to do the following:
  2. Load the MySQL JDBC driver.
  3. Connect to the database "Project" on localhost with username "root" and password "MySQL".
  4. Get the username and password from the request parameters.
  5. Prepare a SQL statement to check if the given username and password exist in the "employee" table.
  6. Set the employeeusername and password in the prepared statement.
  7. Execute the SQL query.
  8. If a result is found (indicating valid credentials):
  9. Forward the request to "DisplayDB."
  10. Else:
  11. Display a JavaScript alert indicating wrong password.
  12. Redirect the client to "EmployeeLogin.html".

#### **4. User Login Servlet Program:**

1. Declare a servlet class named "UserLoginServlet".
2. When a POST request is received:
  1. Try to do the following:
  2. Load the MySQL JDBC driver.
  3. Connect to the database "Project" on localhost with username "root" and password "MySQL".
  4. Get the username and password from the request parameters.
  5. Prepare a SQL statement to check if the given username and password exist in the "user" table.
  6. Set the username and password in the prepared statement.
  7. Execute the SQL query.
  8. If a result is found (indicating valid credentials):
  9. Include the "ReturnPage.html" content in the response.
  10. Else:
  11. Display a JavaScript alert indicating wrong password.
  12. Redirect the client to "UserLogin.html".

#### **4. User Display Database Servlet Program:**

1. Declare a servlet class named "DisplayDB".
2. When a GET request is received:
  1. Set the content type of the response to HTML.
  2. Load the MySQL JDBC driver.
  3. Connect to the database "Project" on localhost with username "root" and password "MySQL".
  4. Prepare a SQL statement to check if the given username and password exist in the "data" table.
  5. Create a Statement object for additional queries.
  6. Print an HTML table header.
  7. Get the column names from the result set metadata.
  8. Print table headers for each column, including an extra header for "WareHouse Status".
  9. Loop through each row in the result set:
  10. Get the return reason and product condition from the row.
  11. If the return reason is "excess\_supply", "wrong\_delivery", or "customer\_dissatisfaction":
  12. Print the row data with "Normal/Undamaged Warehouse" status.
  13. Else if the return reason is "other" and the product condition is "heavily\_damaged" or "Unusable":
  14. Print the row data with "Damaged Warehouse" status.
  15. Else:
  16. Print the row data with "Damaged Warehouse" status.
  17. Print the closing HTML table tags.
  18. Finally, close the output writer.

## APPENDIX-B

### SCREENSHOTS

#### 1.Home Page

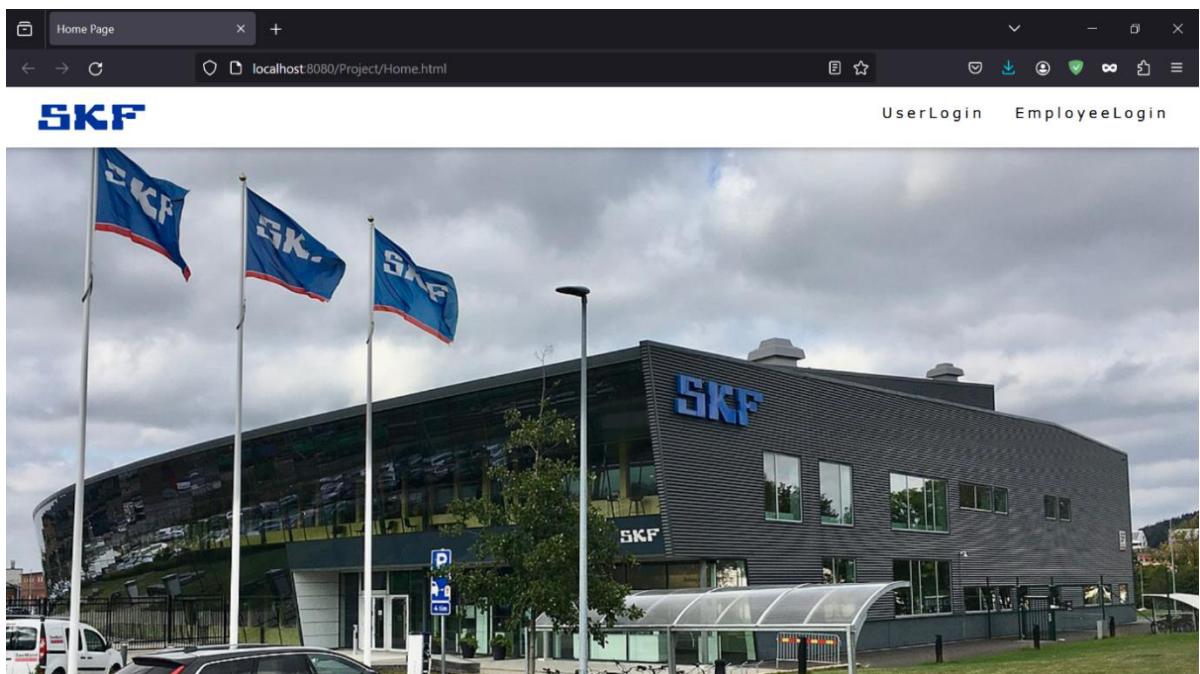

Figure 3. Home Page

Code :

A screenshot of a code editor showing the HTML code for the Home Page. The code is written in a dark-themed code editor. The code includes a DOCTYPE declaration, an HTML structure with a head section containing meta tags and a link to a CSS file, and a body section. The body section contains a header with a logo and links to "UserLogin.html" and "EmployeeLogin.html". Below the header is an image element with the id "home". The code ends with an about section containing a paragraph about SKF's role in everyday life. The code editor has various toolbars and status bars at the top and bottom.

### 3. Employee Login Page

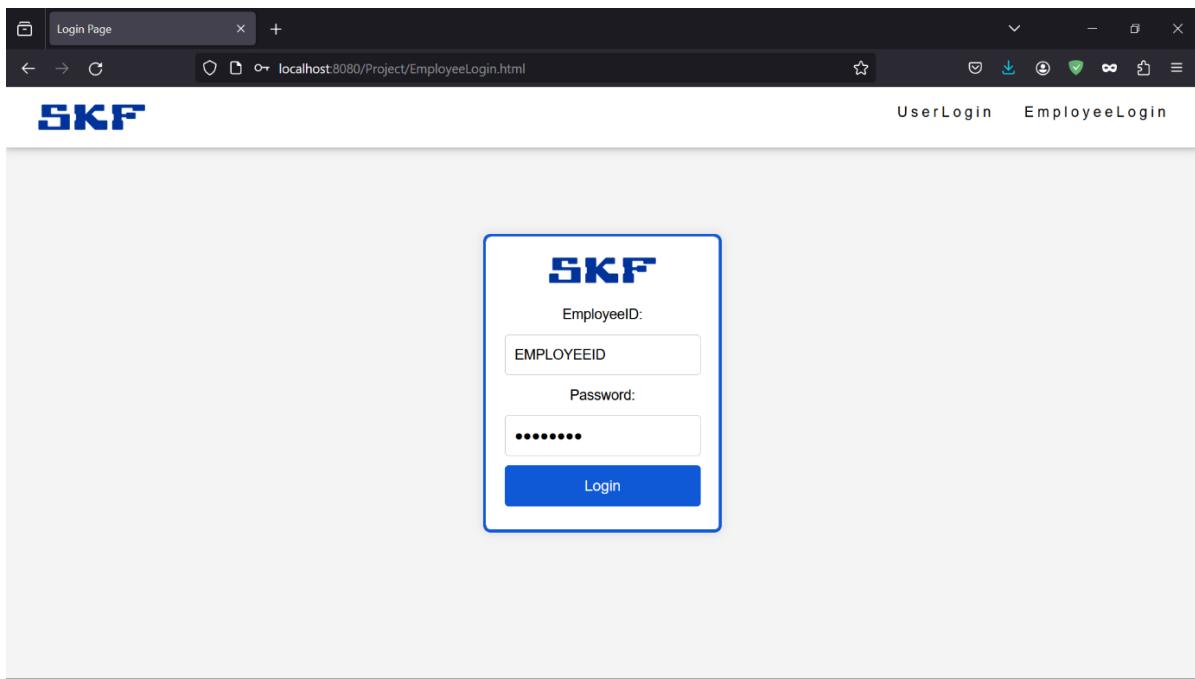

Figure 11. Employee Login

### Code

A screenshot of a code editor window showing the HTML and CSS code for the Employee Login page. The code includes a DOCTYPE declaration, an HTML head section with meta tags for viewport and charset, and a title "Login Page". The body contains a style block defining a "body" class with a font family, background color, margin, padding, display flex, align-items center, justify-content center, and height 100vh. It also defines a "#login-container" class with a background color, padding, border-radius, box shadow, text-align center, height 320px, width 20%, border-style solid, and border-color #00f58d6. The code is numbered from 1 to 33.

Figure 12. Employee Login code-1

The screenshot shows a code editor window with a dark theme. The file is named 'Untitled-3' and contains CSS code for a login form. The code includes styles for a logo, a login form container, input fields, and a login button. The button has a hover state where its background color changes.

```
<!DOCTYPE html> Untitled-3
33
34     #logo {
35         margin-bottom: 20px;
36     }
37
38     #login-form {
39         display: flex;
40         flex-direction: column;
41         gap: 10px;
42     }
43
44     input {
45         padding: 10px;
46         border: 1px solid #ccc;
47         border-radius: 4px;
48     }
49
50     #login-btn {
51         background-color: #0f58d6;
52         color: #fff;
53         padding: 10px;
54         border: none;
55         border-radius: 4px;
56         cursor: pointer;
57         font-size: 16px;
58     }
59
60     #login-btn:hover {
61         background-color: #0f58d6;
62     }
63
64 </style>
65
66 </head>
```

Figure 13. Employee Login code-2

The screenshot shows a code editor window with a dark theme. The file is named 'Untitled-3' and contains the full HTML structure for an employee login page. It includes a header bar with links for UserLogin and EmployeeLogin, and a main content area with a logo and a login form. The login form has fields for EmployeeID and Password, and a submit button.

```
<!DOCTYPE html> Untitled-3

## 6. User Login Servlet Program

The screenshot shows the Eclipse IDE interface with the following details:

- Project Explorer View:** Shows the project structure. The `UserServlet.java` file is selected.
- Code Editor View:** Displays the Java code for `UserServlet.java`. The code implements a `HttpServlet` and overrides the `doPost` method to handle database connections and user login logic using JDBC.

```
1 package com.jspiders.servlet;
2
3 import java.io.*;
4 import java.sql.*;
5
6
7 import javax.servlet.RequestDispatcher;
8 import javax.servlet.ServletException;
9 import javax.servlet.annotation.WebServlet;
10 import javax.servlet.http.HttpServlet;
11 import javax.servlet.http.HttpServletRequest;
12 import javax.servlet.http.HttpServletResponse;
13
14 /**
15  * Servlet implementation class LoginServlet
16  */
17 @WebServlet("/UserServlet")
18 public class UserServlet extends HttpServlet {
19     private static final long serialVersionUID = 1L;
20     //private static DriverManager out;
21
22     /**
23      * @see HttpServlet#HttpServlet()
24      */
25     public UserServlet() {
26         super();
27         // TODO Auto-generated constructor stub
28     }
29
30     /**
31      * @see HttpServlet#doPost(HttpServletRequest request, HttpServletResponse response)
32      */
33     protected void doPost(HttpServletRequest request, HttpServletResponse response) throws ServletException, IOException {
34         // TODO Auto-generated method stub
35         try {
36             Class.forName("com.mysql.jdbc.Driver");
37             Connection con=DriverManager.getConnection("jdbc:mysql://localhost:3306/project?characterEncoding=latin1","root","mysql");
38             String uname=request.getParameter("username");
39             String pwd=request.getParameter("password");
40             PreparedStatement ps=con.prepareStatement("select username from user where username=? and password=?");
41             ps.setString(1, uname);
42             ps.setString(2, pwd);
43             ResultSet rs=ps.executeQuery();
44             PrintWriter out = response.getWriter();
45             if(rs.next())
46             (
47                 out.println("User Found");
48             )
49         }
50     }
51 }
```

*Figure 16. Database code-1*

The screenshot shows the Eclipse IDE interface with the following details:

- Project Explorer View:** Shows the project structure. The main package is `com.main.java`, containing classes `DisplayD8.java`, `EmployeeSer...`, `LoginServlet...`, `ServletJava...`, and `UserServlet...`. There are also sub-folders `src/main/java` and `src/main/webapp`.
- Code Editor View:** Displays the `UserServlet.java` file. The code implements a `doPost` method that connects to a MySQL database, executes a query to check user credentials, and then either prints an error message or forwards the request to `ReturnPage.html`.

```
28 }
29 }
30 /**
31 * @see HttpServlet#doPost(HttpServletRequest request, HttpServletResponse response)
32 */
33 protected void doPost(HttpServletRequest request, HttpServletResponse response) throws ServletException, IOException {
34     // TODO Auto-generated method stub
35     try {
36         Class.forName("com.mysql.jdbc.Driver");
37         Connection con=DriverManager.getConnection("jdbc:mysql://localhost:3306/Project?characterEncoding=latin1","root","mysql");
38         Statement ps=con.createStatement();
39         String pwd=request.getParameter("password");
40         PreparedStatement psm=con.prepareStatement("select username from user where username=? and password=?");
41         ps.setString(1, uname);
42         ps.setString(2, pwd);
43         ResultSet rs=ps.executeQuery();
44         PrintWriter out = response.getWriter();
45         if(rs.next())
46         {
47             RequestDispatcher rd=request.getRequestDispatcher("ReturnPage.html");
48             rd.include(request, response);
49         }
50         else
51         {
52             response.setContentType("text/html");
53             out.println("<script type='text/javascript'>");
54             out.println("alert('Wrong password');");
55             out.println("window.location.assign('UserLogin.html');");
56             out.println("</script>");
57         }
58     }
59     catch(Exception e)
60     {
61         System.out.println(e);
62     }
63 }
64 }
```

*Figure 17. Database code-1*

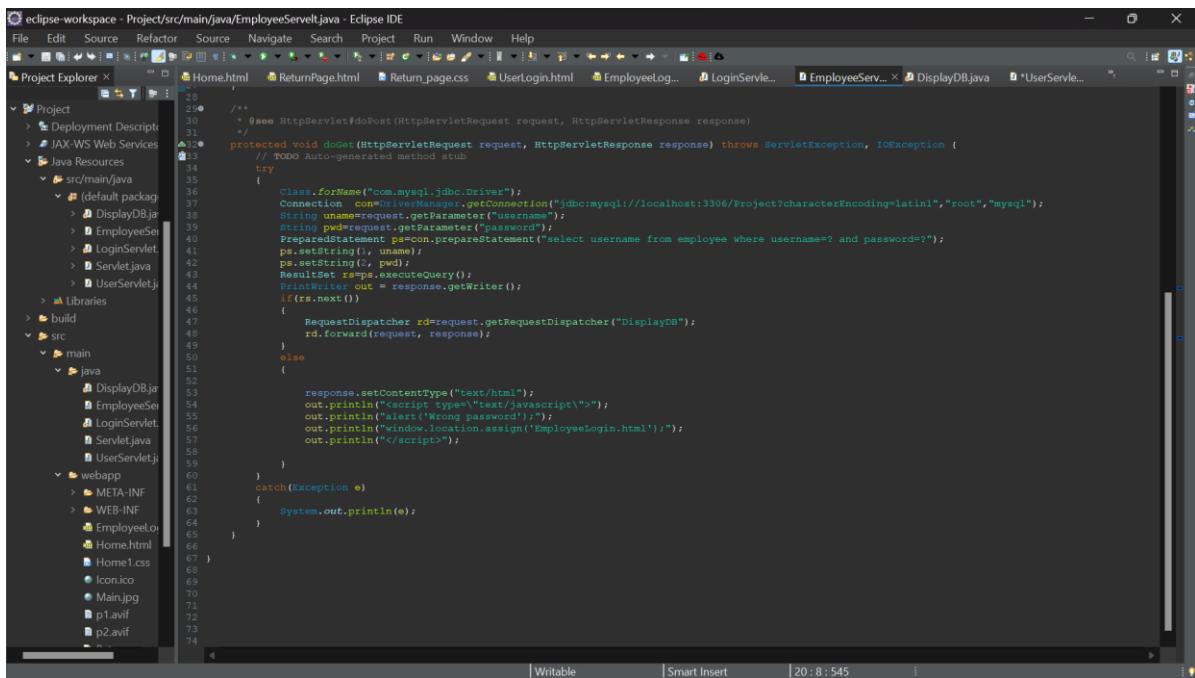

## 7. Employee Login Servlet Program

The screenshot shows the Eclipse IDE interface with the following details:

- Project Explorer View:** Shows the project structure with Java Resources, src/main/java, and webapp.
- Code Editor View:** Displays the code for `EmployeeServlet.java`. The code implements a servlet for handling employee login requests. It uses JDBC to connect to a MySQL database and execute a query to select the user's password based on their username.
- Top Bar:** Shows the menu bar (File, Edit, Source, Refactor, Source, Navigate, Search, Project, Run, Window, Help) and various toolbars.
- Bottom Status Bar:** Shows the current file name (`EmployeeServ...`), the word count (`1`), and the current time (`20:8:545`).

```

The screenshot shows the Eclipse IDE interface with the following details:

- Title Bar:** eclipse-workspace - Project/src/main/java/ServletJava - Eclipse IDE
- Menu Bar:** File, Edit, Source, Refactor, Source, Navigate, Search, Project, Run, Window, Help
- Project Explorer View:** Shows the project structure with Java Resources, src/main/java, and main folders containing Java files like DisplayDB.java, EmployeeSer..., LoginServlet, ServletJava, and UserServlet.java.
- Editor View:** Displays the Java code for the `Servlet.java` file. The code includes annotations for `@WebServlet`, `@.WebServlet(name = "HelloWorld")`, and `@.WebServlet(path = "/Servlet")`. It contains methods `doGet` and `doPost` that interact with a MySQL database using JDBC. The code uses prepared statements to insert data into a table named `data`.
- Bottom Status Bar:** Shows Writable, Smart Insert, and the current time as 17:1:387.

*Figure 21. Servlet program code-2*

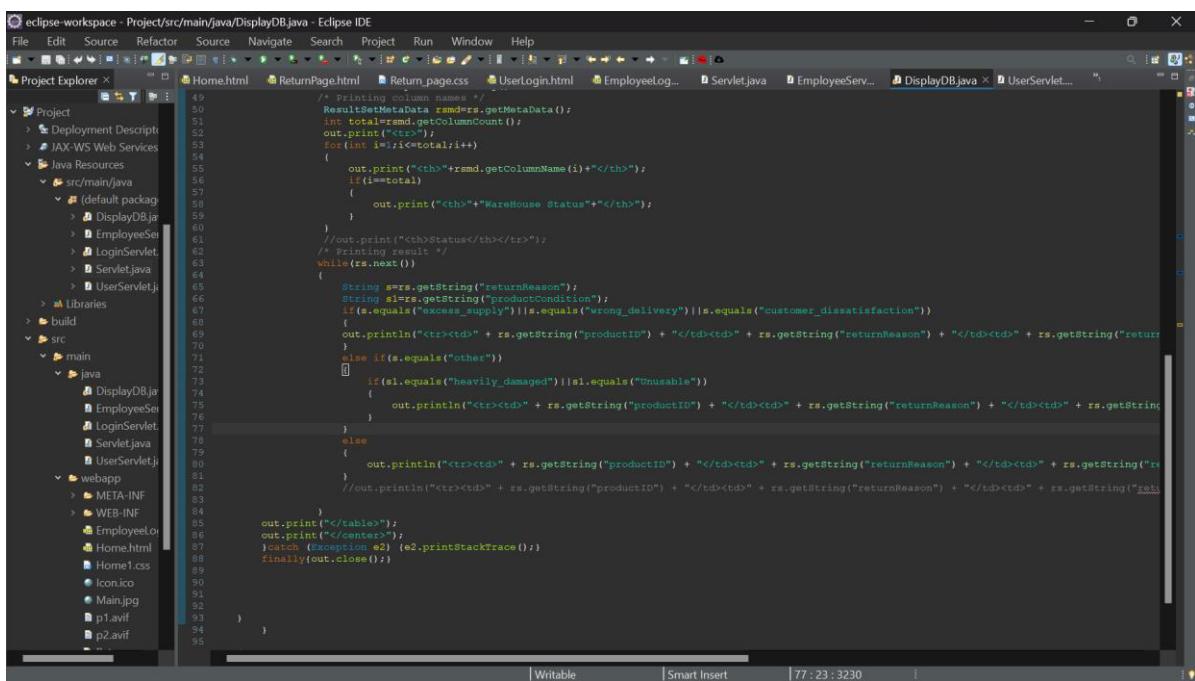

## **8. Data base Display Servlet Program**

The screenshot shows the Eclipse IDE interface with the following details:

- Project Explorer View:** Shows the project structure:
  - Project: eclipse-workspace - Project/src/main/java/DisplayDB.java
  - Deployment Descriptor: Deployment Descriptor
  - JAX-WS Web Services: JAX-WS Web Services
  - Java Resources:
    - src/main/java
      - (default package)
        - DisplayDB.java
        - EmployeeServlet.java
        - LoginServlet.java
        - Servlet.java
        - UserServlet.java
    - Libraries: Libraries
    - build
    - src
      - main
        - java
          - DisplayDB.java
          - EmployeeServlet.java
          - LoginServlet.java
          - Servlet.java
          - UserServlet.java
    - wabapp
      - META-INF
      - WEB-INF
        - EmployeeLog...
        - Home.html
        - Home1.css
        - Icon.ico
        - Main.jpg
        - p1.wav
        - p2.wav

- Code Editor View:** Displays the Java code for `DisplayDB.java`. The code includes imports for various Java packages, annotations like `@WebServlet`, and a main method that establishes a database connection, prepares a statement, and prints column names.

*Figure 22. Database Display Servlet program code-1*

The screenshot shows the Eclipse IDE interface with the 'DisplayDB.java' file open in the editor. The code is a Java servlet that prints the contents of a database table to a response stream. It uses JDBC to get column names, total columns, and rows from a ResultSet object named rs. The code then iterates through each row, printing the product ID, return reason, and quantity for each item. It handles different return reasons like excess supply, wrong delivery, customer dissatisfaction, and others. Finally, it prints a closing table tag and ends the response.

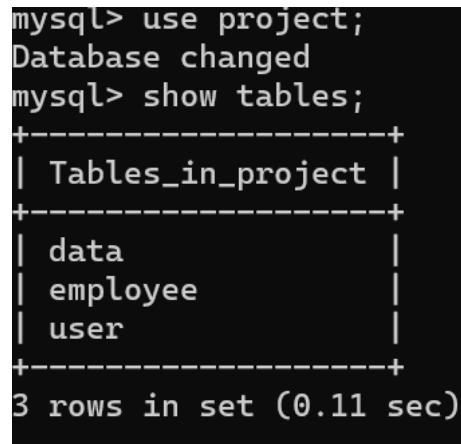

```

49     /* Printing column names */
50     ResultSetMetaData rsmd=rs.getMetaData();
51     int total=rs.getMetaData().getColumnCount();
52     out.print("<tr>");
53     for(int i=1;i<total;i++)
54     {
55         out.print(" <th>" + rsmd.getColumnName(i) + "</th>");
56         if (i==total)
57             {
58                 out.print(" <th>WareHouse Status</th>");
59             }
60         //out.print("<th>Status</th></tr>");
61     /* Printing result */
62     while(rs.next())
63     {
64         String srs=rs.getString("returnReason");
65         String srs2=rs.getString("productCondition");
66         if(s.equals("excess_supply")||s.equals("wrong_delivery")||s.equals("customer_dissatisfaction"))
67             {
68                 out.println("<tr><td>" + rs.getString("productID") + "</td><td>" + rs.getString("returnReason") + "</td><td>" + rs.getString("returnQuantity"));
69             }
70             else if(s.equals("other"))
71             {
72                 if(s1.equals("heavily_damaged"))|s1.equals("Unusable"))
73                     {
74                         out.println("<tr><td>" + rs.getString("productID") + "</td><td>" + rs.getString("returnReason") + "</td><td>" + rs.getString("returnQuantity"));
75                     }
76                 else
77                     {
78                         out.println("<tr><td>" + rs.getString("productID") + "</td><td>" + rs.getString("returnReason") + "</td><td>" + rs.getString("returnQuantity"));
79                     }
80             }
81         }
82     //out.println("<tr><td>" + rs.getString("productID") + "</td><td>" + rs.getString("returnReason") + "</td><td>" + rs.getString("returnQuantity"));
83     }
84     out.print("</table>");
85     out.print("</center>");
86 }catch (Exception e2) {e2.printStackTrace();}
87 finally{out.close();}
88

```

## Sustainable Development Goals:

By developing web application for efficient product return management in order to minimize losses and reduce scrap material aligns with several Sustainable Development Goals (SDGs), particularly focusing on economic growth, responsible consumption, and industry innovation. Specifically, the relevant SDGs include:

### 1. SDG 8: Decent Work and Economic Growth

- The solution aims to enhance the efficiency of return management processes, contributing to improved economic growth by minimizing losses and optimizing resource utilization within the supply chain.

### 2. SDG 9: Industry, Innovation, and Infrastructure

- The development of a web application using technologies such as HTML, CSS, JavaScript, Java Full Stack, and MySQL reflects an innovative approach to improving industry practices in supply chain management.

### 3. SDG 12: Responsible Consumption and Production

- The emphasis on proper justification for returns and a decision-making process aligns with the goal of promoting responsible consumption and production by reducing waste and

optimizing the use of resources.

#### **4. SDG 14: Life Below Water (indirectly)**

- By minimizing losses and reducing the amount of scrap material through effective return management, there is an indirect contribution to preventing pollution and minimizing negative impacts on marine ecosystems.

While the primary focus is on SDGs 8, 9, and 12, the overall objective of the solution indirectly supports various other sustainable development goals by promoting efficient and responsible business practices within the context of product return management.
